Re: Traffic Analysis for the Proposed 31 Single Family Homes in Madison County, MS

Dear Mr. Sartain:

Per your request, Neel-Schaffer has conducted an analysis of the proposed residential development on Catlett Road in Madison County, MS. This letter is intended to provide traffic analysis information regarding the development of the property between Falls Crossing and Catlett Road, south of Luebirdia Lane. Development of the 9.2 acre project site is planned to include 31 single family homes. Access to the site is proposed to include a single site driveway on Catlett Road. The existing cross section of Catlett Road adjacent to the site includes a 2-lane roadway with 24 ft of asphalt. The project site plan is provided in **Figure 1-Site Plan**. The graphics referenced in this letter are provided as attachments.

Existing Conditions

A field inventory of the project site was conducted to document the existing conditions of the site and traffic control within the project limits. The posted speed limit on Catlett Road is 45 mph adjacent to the site, while northbound traffic has a curve warning sign with an advisory speed of 30 mph.

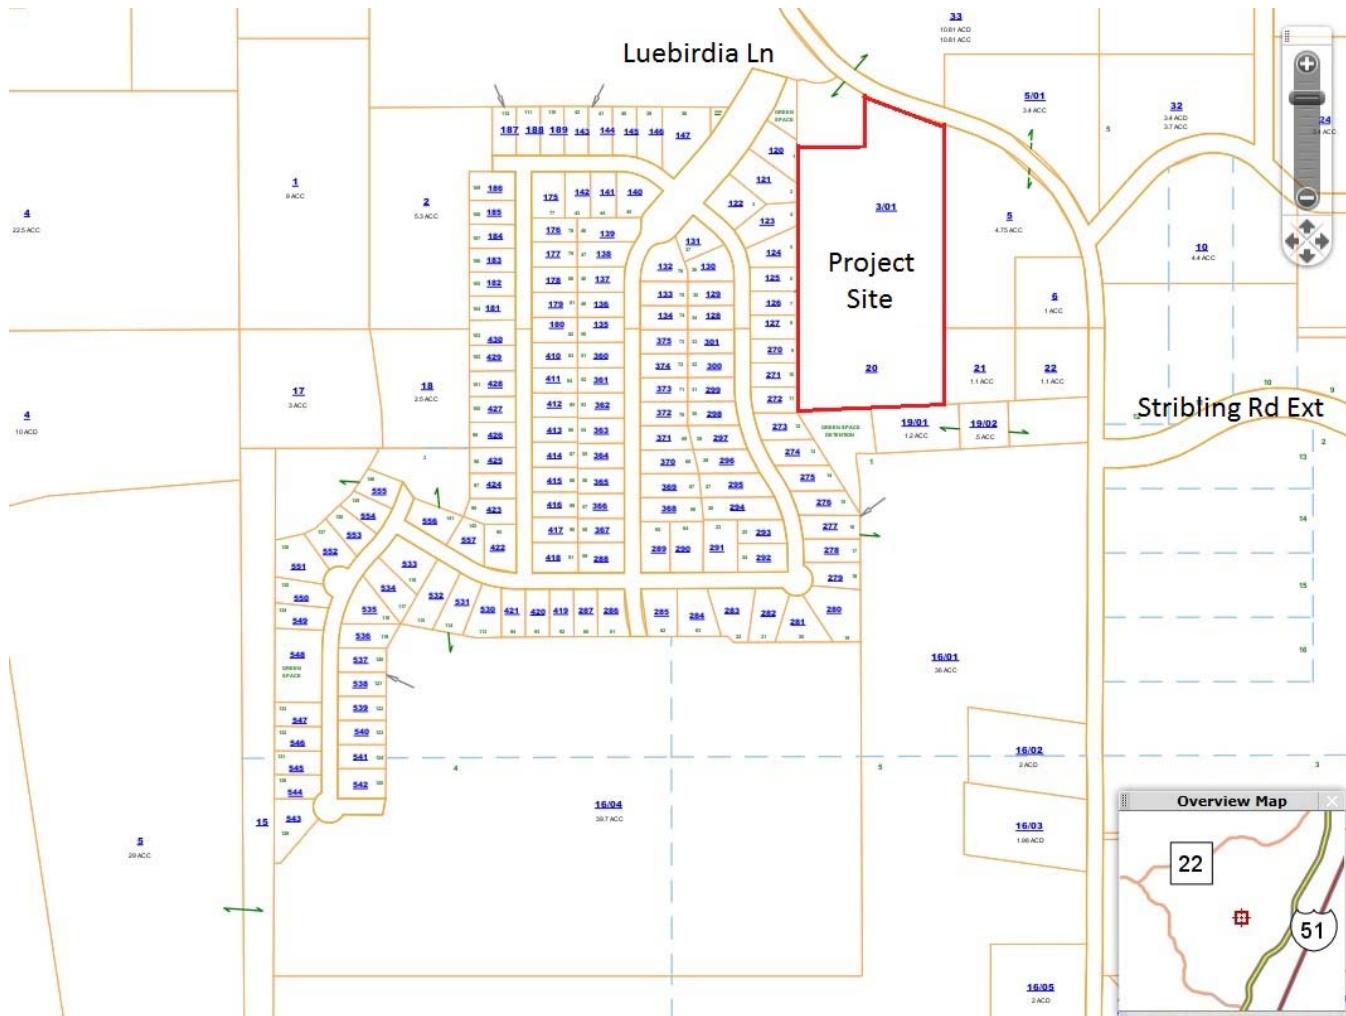

The project site is currently occupied with a single family home with a concrete driveway connecting to Catlett Road at the northeast property corner and a dirt driveway/culvert at the northwest property corner.

Source: Neel-Schaffer, Google Earth, 2018.

Falls Crossing subdivision is adjacent to the site to the west, with approximately 170 residential single family lots. The other land adjacent to the site is either large acre/low density development, or undeveloped property. Higher density developments exist along Stribling Road to the north/west and along Stribling Road Extension, east of the site.

There are significant traffic peaks in the AM and PM peak hours, as most traffic travels southbound in the AM peak and northbound in the PM peak, adjacent to the project site. A peak hour turning movement count was conducted on 8/9/18 at the adjacent intersection of Luebirdia Lane/Catlett Road.

Madison County Tax Map

Source: TSC Maps, Neel-Schaffer, 2018.

The year 2018 peak hour traffic volumes adjacent to the site are shown in **Figure 2**.

Trip Generation/Assignment

The trip generation characteristics of the proposed residential development were calculated using the Institute of Transportation Engineers (ITE), Trip Generation, 9th Edition. The site is planned to be an age restricted community for residents 55 years old and older. ITE has a standard “Single Family Home” rate and a rate for “Senior Adult Housing – Detached.” The two rates yield similar values for peak hour traffic, with daily volumes higher for standard Single Family Homes. An average of the two independent variable calculations was used to estimate the site’s trip generation characteristics. The results of the trip generation calculations are shown in **Table 1**.

Table 1
Trip Generation

Land Use	Intensity	Daily Trips	AM Peak Hour			PM Peak Hour		
			Total	In	Out	Total	In	Out
Single Family Homes	31 D.U.	358	31	8	23	37	23	14
	31 D.U.	167	35	12	23	19	12	7
	Average	263	33	10	23	28	18	10
Daily Traffic Generation								
		Single Family Homes [ITE 210]	=	$\text{Ln}(T) = 0.92 * \text{Ln}(\# \text{ D.U.}) + 2.72$				
		Sr. Adult Housing-detached [ITE 251]	=	$\text{Ln}(T) = 0.89 * \text{Ln}(\# \text{ D.U.}) + 2.06$				
AM Peak Hour Traffic Generation								
		Single Family Homes [ITE 210]	=	$T = 0.70 * \# \text{ D.U.} + 9.74 ; (25\% \text{ in}/75\% \text{ out})$				
		Sr. Adult Housing-detached [ITE 251]	=	$T = 0.17 * \# \text{ D.U.} + 29.95 ; (35\% \text{ in}/65\% \text{ out})$				
PM Peak Hour Traffic Generation								
		Single Family Homes [ITE 210]	=	$\text{Ln}(T) = 0.90 * \text{Ln}(X) + 0.51 ; (63\% \text{ in}/37\% \text{ out})$				
		Sr. Adult Housing-detached [ITE 251]	=	$\text{Ln}(T) = 0.75 * \text{Ln}(X) + 0.35 ; (61\% \text{ in}/39\% \text{ out})$				

Source: ITE Trip Generation, 9th Edition, Neel-Schaffer, 2018. X = # Dwelling Units

The average of the two independent variable calculations was used for the trip generation of the project site. The project site traffic is shown graphically in **Figure 3**.

Non-site traffic volumes were evaluated based on a review of MDOT historical daily traffic volumes, local traffic counts and census data. The volumes on Catlett Road south of Stribling Road Extension (count station #451162) showed an increase in daily traffic from 7,000 vpd in 2013 to 7,500 vpd in 2017, a 1.74% compound annual growth rate. Local traffic counts from Catlett Road in 2016 and 2018 were compared and identified an average of 3.7% increase (compounded annually). The US census data for Madison County revealed a growth in population from 1990-54,271 to 2015-103,465, a 2.61% compound annual growth rate. The average of the MDOT count, NS count and Census data yielded a 2.7% compound annual growth rate. Non-site traffic was forecast to the horizon year/buildout 2021 using a 2.7% compound annual growth rate. The project site traffic was then added to the non-site traffic to evaluate the impacts to the roadway adjacent to the site for buildout (2021) total traffic. The projected 2021 Total Traffic is shown in **Figure 4**.

Traffic Impacts

The intersection delays were evaluated using the information provided in the *Highway Capacity Manual* to evaluate the levels-of-service (LOS) for the study intersections. The LOS analysis included the existing and future traffic (2021-Non-Site & Total traffic at buildout). The intersections identified in this analysis include the adjacent unsignalized intersection of Luebirdia Ln/Catlett Road, Stribling Road Extension/Catlett Road, and the proposed project site driveway. The capacity analysis sheets are provided as an attachment to this letter/report. The capacity analysis results are summarized in **Table 2**.

Table 2
Capacity Analysis Summary

Source: Neel-Schaffer, 2018, HCM 2010.

The site driveway is forecast to operate at acceptable levels (from a capacity perspective) with the development of the project site. The non-site traffic analysis and total traffic analysis reveals that the adjacent intersection of Catlett Road with Stribling Road Extension is near capacity with existing traffic. Without the development of the project site, the adjacent intersection is shown to be over capacity with minimal background growth. Signalization of the adjacent intersection, or construction of a roundabout would help to offset these capacity issues, with or without the development of the project site.

Sight Distance

The AASHTO A Policy on Geometric Design of Highway and Streets (Green Book), identifies that the critical design factor is Stopping Sight Distance (SSD). According to the “Green Book”, if the available intersection sight distance for an entering or crossing vehicle is at least equal to the appropriate SSD for the major road, then drivers have sufficient sight distance to anticipate and avoid collisions. In some cases, this may require a major road vehicle to stop or slow to accommodate the maneuver of the minor road vehicle. While intersection sight distance is desirable, SSD is a mandatory condition and must be met.

Looking north from proposed site drive on Catlett Road at the vegetation impacts on sight distance.

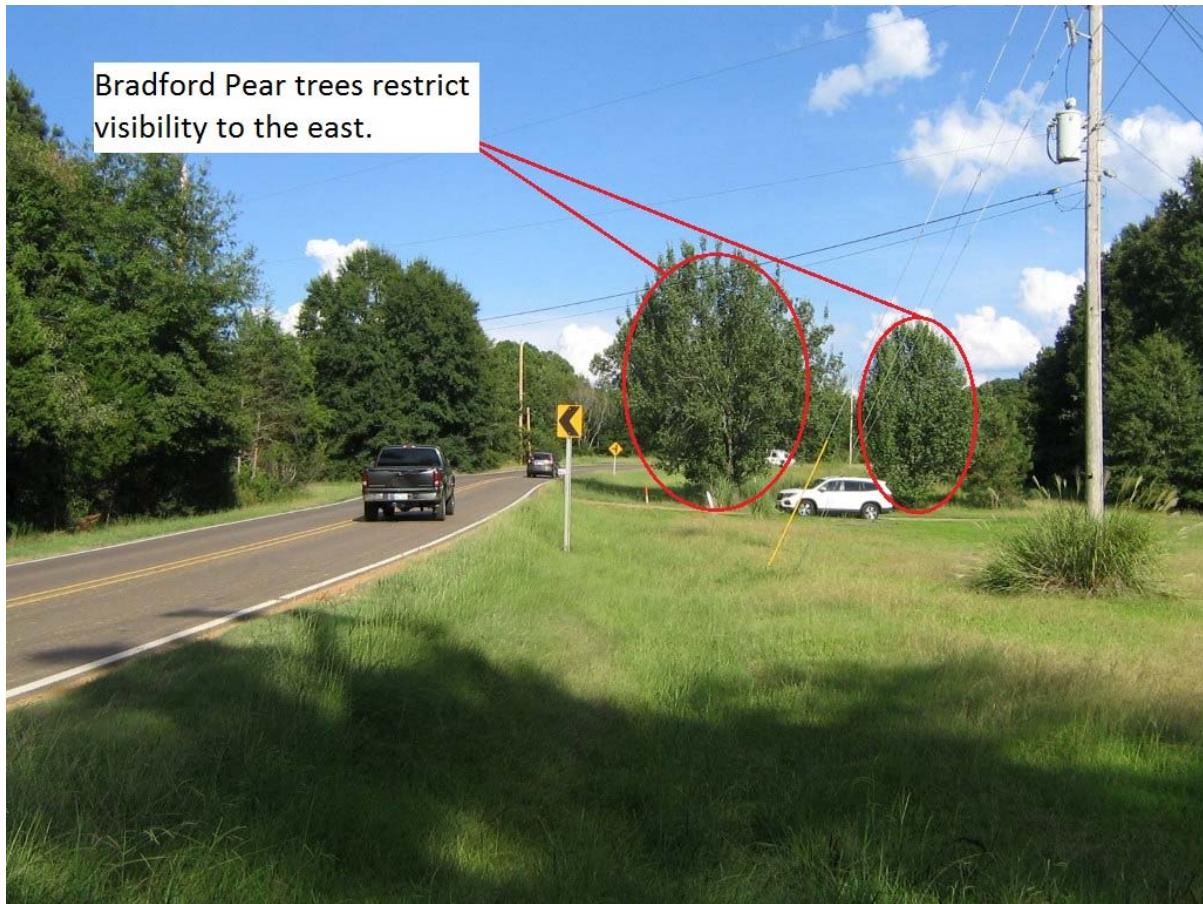

Horizontal curves on Catlett Road along with trees/tall grass present limitations on available sight distance. Intersection sight distance for a major road driver to identify a vehicle entering the roadway is measured from a driver's eye height of 3.5 ft. The height of object is 4.35 ft, with the top 10 inches of the automobile that would need to be visible for the object to be identified as a vehicle. The sight distance criteria is intended for a major road vehicle identifying an entering/crossing vehicle to allow reciprocal sight distance, allowing each driver to see the other driver, a sight distance of 3.5 ft to 3.5 ft was evaluated. The posted speed on Catlett Road is 45 mph, while northbound traffic has a curve warning sign with a 30 mph speed. Design speed is typically 5-10 mph higher than posted speed. The Stopping Sight Distance requirements outlined in the “Green Book” are listed in **Table 3**.

Table 3 - Stopping Sight Distance

Design Speed (mph)	Stopping Sight Distance (ft)
45	360
50	425
55	495

Note: SSD is for passenger cars on a level roadway.

Source: AASHTO, A Policy on Geometric Design of Highway and Streets, 2011.

Intersection Sight Distance was measured with a measuring wheel in the field from a point 14.5 ft from the edge of traveled way to the right and left for the project site driveway located at the existing culvert/dirt driveway near the northwest property line. The distance was measured from a driver's eye height of 3.5 ft to a height of object of 3.5 ft. The mandatory SSD required would be 425 ft for a 50 mph design speed and 45 mph posted speed limit. The measured Intersection Sight Distance is listed in **Table 4** and is shown in **Figure 5**.

Table 4 - Field Measured Sight Distance

Condition	Major Street	Cross Street	Intersection Sight Distance	
			Left	Right
Existing	Catlett Road	Site Driveway	490'	550'
Trimmed Vegetation	Catlett Road	Site Driveway	600'	730'

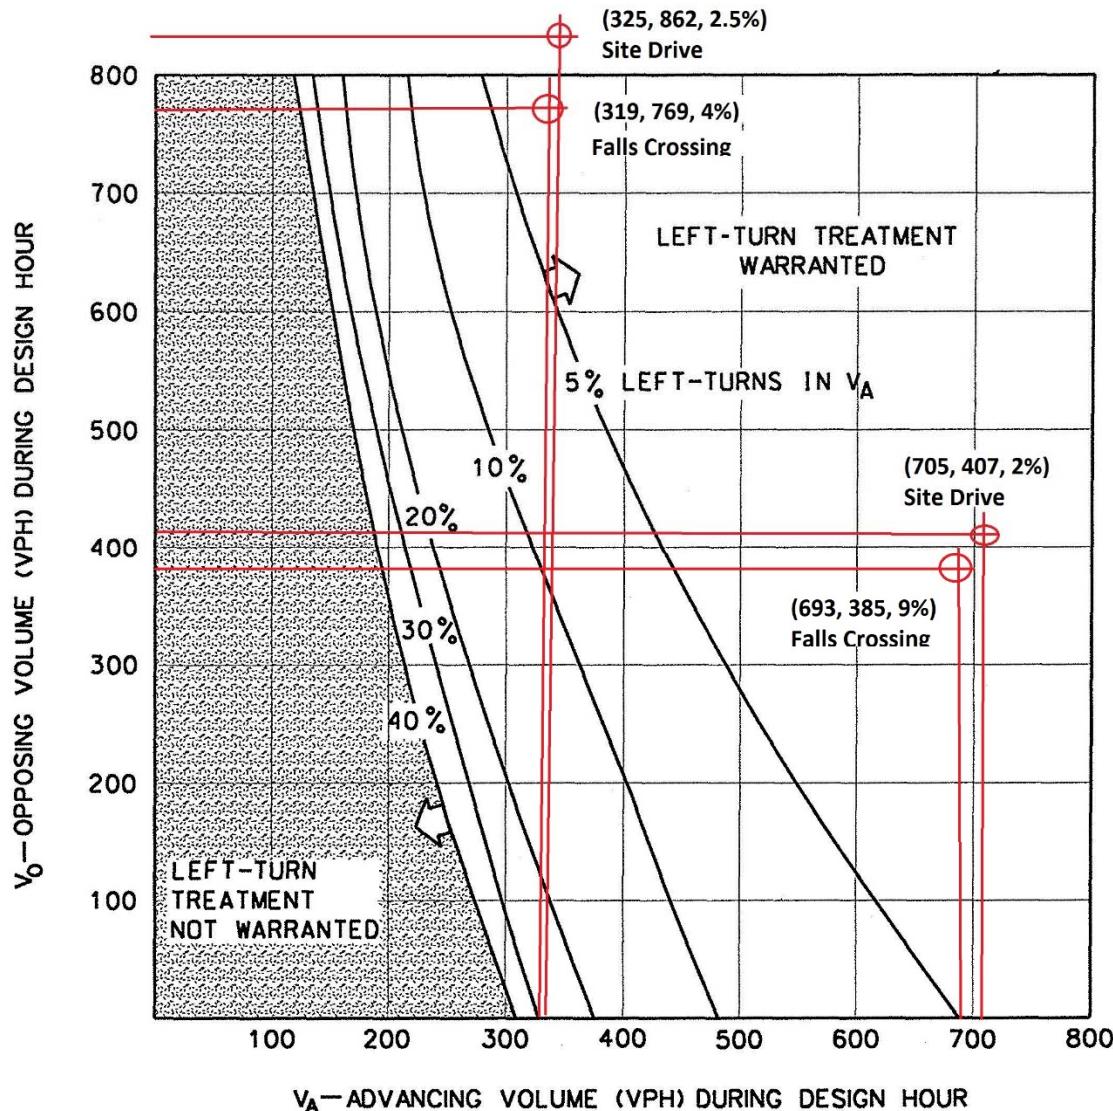

Source: Neel-Schaffer, 2018.

Based on the field measurements, Intersection Sight Distance at the study intersections exceeds the minimum Stopping Sight Distance conditions. Based on the field measurements, an approaching driver traveling at 5 mph over the posted speed would require 425 ft of Stopping Sight Distance. The site driveway was field measured and identified to exceed the minimum requirements for Stopping Sight Distance at 5 mph over the posted speed. While the roadway is posted at 45 mph for the speed limit, State law in Mississippi prohibits County Sheriffs from using radar for speed enforcement in unincorporated areas. The 45 mph posted speed limit is not enforceable, however, the horizontal curves present limitations on speed at the site driveway. Clearing the vegetation/cutting/maintaining the grass in the ditch opposite the site driveway, concurrent with trimming the pine tree limbs that encroach into the line of sight is recommended to increase the intersection sight distance for traffic approaching from the left (north). Additionally, the two Bradford Pear trees are recommended to be removed and grass maintained to the right (east) to increase intersection sight distance to (in excess of) 700 ft. Clearing the vegetation in these sight triangles and maintaining landscaping/grass was measured to increase Intersection Sight Distance to nearly 55 mph design standards for traffic approaching from the left, and in excess of 55 mph criteria from the right.

Auxiliary Turn Lane Warrants

The need for auxiliary turn lanes at the site driveway was evaluated to determine if left turn or right turn ingress lanes were warranted. The MDOT auxiliary turn lane graphs were used to evaluate the site driveway and the adjacent driveway for Falls Crossing (Luebirdia Ln) to see if the existing and proposed driveways would meet the turn lane warrants. The right turn lane warrant is based on the number of right turning vehicles and total volume of traffic in the same direction as the right turning volume. The graph for right turning traffic does not meet the threshold volume if right turning traffic is below 40 vph in the design hour. Neither Falls Crossing nor the project site were counted to have (or forecast to have) more than 15 vph turning right in the peak hours, and therefore would not meet the threshold volumes for construction of a southbound right turn ingress lane.

The left turn lane warrant is based on the volume of traffic on the major street advancing (V_a) and volume of traffic opposing (V_o) the advancing traffic on the adjacent roadway, along with the percentage of left turns in the volume advancing. The volumes were plotted on the graph, and if the plotted point is to the right of the percentage of left turn line on the graph, then a left turn lane is warranted.

Source: Neel-Schaffer, MDOT 2018.

The plotted points for Falls Crossing both (AM & PM peaks) meet the left turn lane warrant, although no left turn lane is currently provided. The site driveway volumes appear to be just at, or marginally below the threshold percentage for meeting the left turn lane warrant, based on the low volume of left turn traffic forecast for the project site. The construction of a center turn lane on Catlett Road for the adjacent subdivision of Falls Crossing would help to improve traffic circulation, as well as benefit the proposed new subdivision. A center turn lane would allow left turns out of the two subdivisions to make the movements as two stage movements, requiring a gap in major street traffic in only one direction at a time. A center turn lane would help to keep northbound traffic flowing more freely and left turning traffic would have less impact on Catlett Road.

Mr. Brian Sartain

Recommendations

No major street capacity related issues were identified with the capacity analysis of the proposed site driveway or the adjacent intersection of Luebirdia Lane based on the traffic count and proposed trip generation of the residential development. The adjacent unsignalized intersection of Stribling Road Extension/Catlett Road is shown to have significant delays on the minor street in the peak hours with a minimal increase in background traffic during the peak hours in year 2021. Modification of the traffic control to a signalized intersection with auxiliary left turn lanes, or construction of a roundabout would mitigate these anticipated delays. According to the Federal Highway Administration (FHWA), roundabouts reduce fatal and life-threatening crashes by more than 80% over conventional signalized intersections and help to reduce travel speeds. The combination of a roundabout and the construction of a center two-way left turn lane (TWLTL) are recommended on Catlett Road to accommodate the existing and background traffic growth and are necessary improvements (without the development of the project site). The project site is not anticipated to have a significant capacity impact on Catlett Road or on adjacent intersections. The sight triangles for the site driveway are recommended to be cleared and maintained, concurrent with the development of the project site and construction of the new site driveway. The recommended improvements are shown graphically in Figure 6.

If you have any questions or comments regarding this analysis, please call me at (601) 948-3071.

Sincerely,

NEEL-SCHAFFER, INC.
